## 1000 Public Health and Safety: Water Sampling Protocols Introduction

Through the collection and analysis of water samples, responders can uncover valuable data needed to inform decisions related to response tactic deployment, determining cleanup endpoints, waterway closures, recreational and consumption advisories, and fisheries management. During a response, water sampling may be necessary to answer a variety of questions. For example:

- What is the source of the spill?
- Is oil/hazardous substance detected in the surface water samples?
- Is the water body of acceptable quality for recreation, fish consumption, irrigation, or a designated beneficial use?
- Is oil/hazardous substance migrating?
- Is water quality improving or worsening?
- Is sediment and tissue sampling required?

This document contains guidance and plan templates to standardize the process to collect, analyze, and disseminate sampling results that can support decision-making during a response. Sampling guidance throughout the plan only covers surface water. All sampling fieldwork is to be conducted in accordance with the site safety plan developed for the response.

**Note:** The Central Texas Coastal Area Committee developed this document. The formatting of the Water Sampling Plan is styled after a previously published version; reformatting will occur during future updates.
